When user clicks on Proceed for payment, a Content Dialog control appears telling that payment link is sent to customer on their mobile phone and email address. Once the customer confirms the payment on their device, user then has to press on Continue.

Seat Selection functionality updated

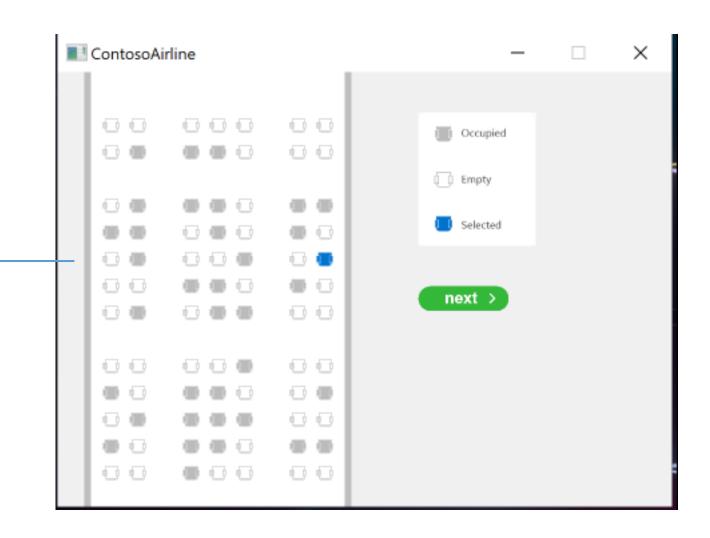

The seat selection UI shown below is coded using Simple Direct Media Layer (SDL) C/C++ library which helps in rendering graphic using OpenGL and Direct3D. According to the demo, this piece of seat selection utility is already available with Contoso Airline company coded in C++ for Windows as traditional Desktop application. We converted the code into a DLL and invoking it using Code Reflection. This capability was not available in UWP hence we used a Win32 WinUI template to provide modern user interface to the Contoso Airline for their point of service without requiring re-code of their critical logic.

Another important aspect of this integration is the way how it is achieved as mentioned above.

Right now, we are dynamically loading DLL on the runtime and using reflection to load the library and invoke the code.

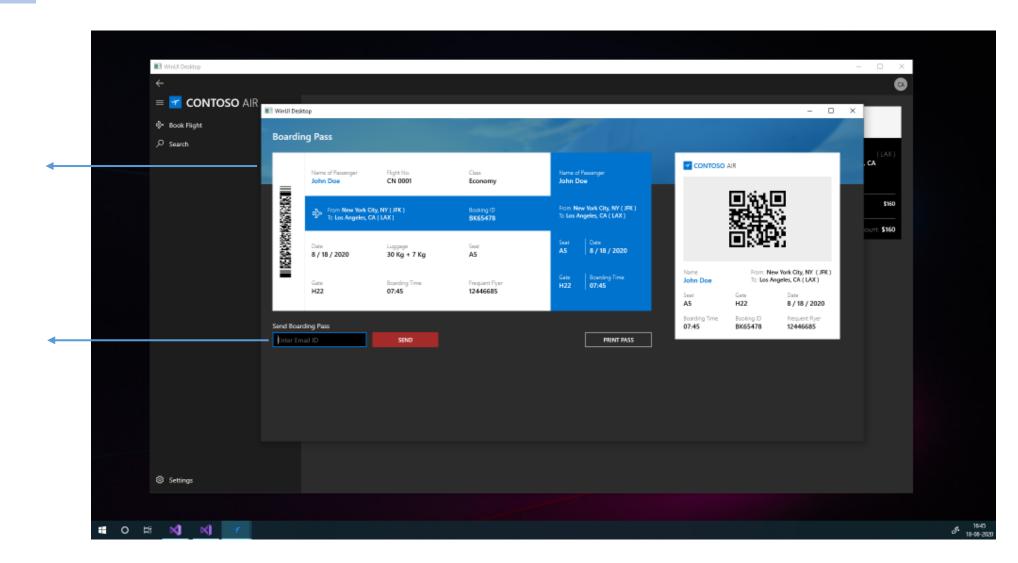

This will be a useful method if the developers want to invoke any pre-packaged Win32 code.

Boarding Pass Page

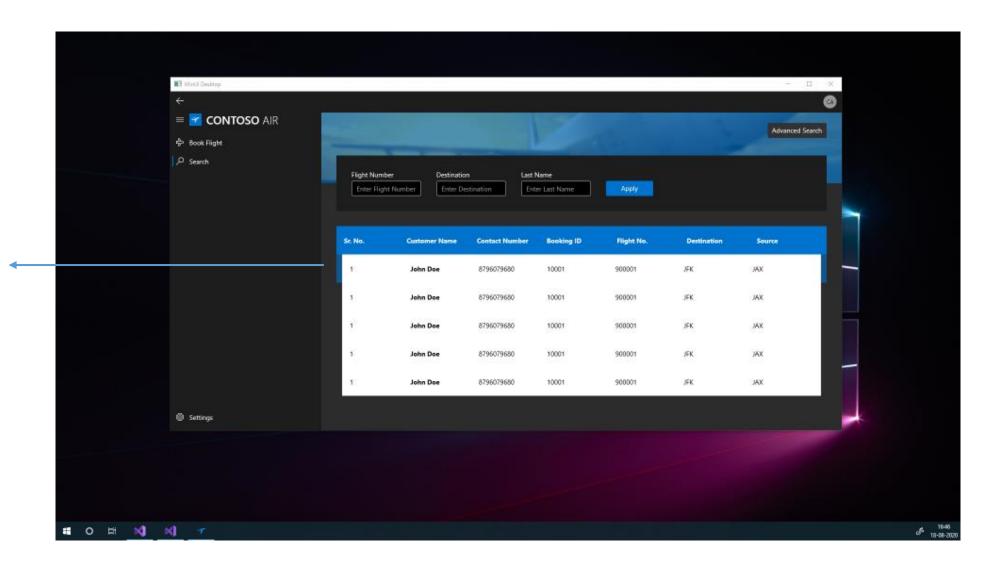

A static Boarding pass opens in new Window.

Text Box for user to enter customer's email ID for sharing boarding pass.

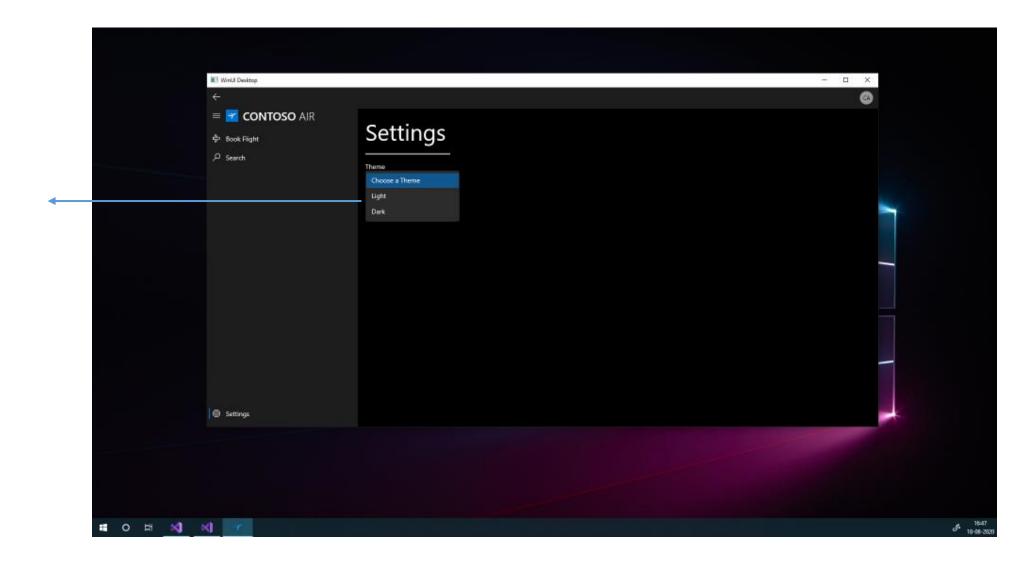

Search Booking Page

Search booking page is a static booking page which showcases a simple form at top to search booking and at bottom we see the list of relevant bookings
